Candidate App for Voting Advice Application

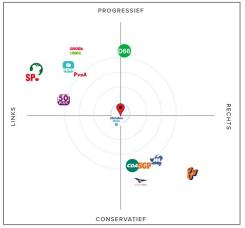

Aalto SW Project Course • 11 October 2023

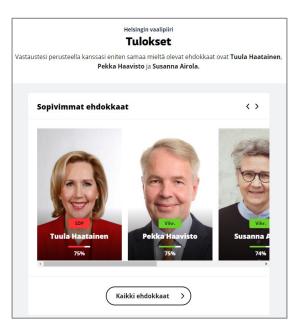

VAAs are online applications that help voters pick a candidate or party to vote for

OpenVAA

OpenVAA

Modular open-source platform for making voting advice applications

Use cases:

- Governmental elections
- Organisations' internal elections
- Research prototypes

Many VAAs in Finland are not open source, but commercial and/or proprietary products

OpenVAA seeks to create transparency for voting advice applications and promote adoption of VAAs worldwide

Technologies used:

- Languages: TypeScript HTML CSS JSON
- Frontend: Svelte DaisyUI/Tailwind
- Backend: Sveltekit/Node.js
 Strapi/Postgres
- CI/CD: Docker Husky Vitest GitHub Actions
- Design: Figma
- Collaboration: Slack Google Docs

OpenVAA

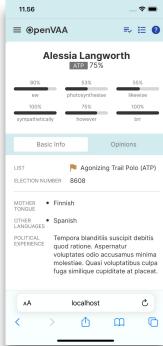

Voter App WIP

SW Project Course Goals

- Current OpenVAA application has support for voters answering questions from frontend, but candidate answers and all data is managed only directly from backend (Strapi CMS + NodeJS)
- The goal for the project is to develop support for candidates to submit their answers & profiles to the OpenVAA system
- This includes the candidate view frontend using the current voter frontend template (SvelteKit) as a starting point well as extending Strapi
- We also have Figma designs for the candidate app as a reference point but these can be redesigned if required
